ABSTRACT:

An Internet information device includes a web site coupled to a first user intranet point and a second user Internet point. The first user point is coupled for providing multi-level managed information to the web site. The second user point is coupled for providing multi-level user access to the managed information such that a selected password provides user access to all of the managed information and another selected password provides user access to a limited portion of the managed information.

ABSTRACT:

A method and system for automatically providing remote notification of a locally
detected event includes receiving data and analyzing the content of the data using
a data filter of a computer. The data filter is configured to detect an indication
of a predetermined event within the data. If the event is detected, the data
filter activates a local event indicator associated with the computer. An event
indicator monitor determines whether a user response is initiated within a
configurable time interval after activation of the event indicator. If the monitor
determines that no user response is initiated within the configurable time
interval, the monitor transmits an establish-connection message to a control
program. The control program responds to the establish-connection message by
accessing an event notification message from a database which indicates access
numbers of the remote communication devices to which to transmit the event
notification message. Communication links are established to the remote
communication devices and the event notification message is transmitted to the
devices. The data filter is capable of analyzing data included in web page updates
transmitted to a web browser of the computer, e-mail messages, scheduling updates
and requests transmitted to an electronic calendar of the computer, and scheduling
reminders transmitted by the electronic calendar.

ABSTRACT:

A technique that, through continual computation, harnesses available computer resources during periods of low processing activity and low network activity, such as idle time, for prefetching, e.g., web pages, or pre-selected portions thereof, into local cache of a client computer. This technique utilizes, e.g., a probabilistic user model, which specifies, at any one time, those pages or portions of pages that are likely to be prefetched given, e.g., a web page currently being rendered to a user; these pages being those which promise to provide the largest benefit (expected utility) to the user. Advantageously, this technique prematurely terminates or retards a current information download for a user in favor of prefetching a web page of future interest to that user whenever the latter page exhibits greater current incremental benefit to that user, in terms of a discounted expected rate of refinement in value with time for the future page, than a current incremental benefit being obtained for that user by continuing the current download.

ABSTRACT:

A visual Web site analysis program, implemented as a collection of software components, provides a variety of features for facilitating the analysis and management of Web sites and Web site content. A mapping component scans a Web site over a network connection and builds a site map which graphically depicts the URLs and links of the site. Site maps are generated using a unique layout and display methodology which allows the user to visualize the overall architecture of the Web site. Various map navigation and URL filtering features are provided to facilitate the task of identifying and repairing common Web site problems, such as links to missing URLs. A dynamic page scan feature enables the user to include dynamically-generated Web pages within the site map by capturing the output of a standard Web browser when a form is submitted by the user, and then automatically resubmitting this output during subsequent mappings of the site. The Web site analysis program is implemented using an extensible architecture which includes an API that allows plug-in applications to manipulate the display of the site map. Various plug-ins are provided which utilize the API to extend the functionality of the analysis program, including an action tracking plug-in which detects user activity and behavioral data (link activity levels, common site entry and exit points, etc.) from server log files and then superimposes such data onto the site

map.
